In response to a communication dated 3/15/07, an amendment dated 1/17/07 has been entered and considered with the following results:

***Claim Rejections - 35 USC § 103***

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 1 and 2 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kumon et al. (JP 2000322742A).

Regarding claims 1 and 2, Kumon et al, according to Fig. 2 and an abstract, teaches an optical disk device (see Fig. 2), which is used for identifying a kind of an optical disk and operated depending upon the kind of the identified disk, comprising: a detector (207) for performing a step of detecting a wobble signal recorded on a recording surface of the disk; a determiner (208) for performing a step of determining a number of a cycle of the wobble signal detected by the detector by comparing the cycle of the wobble signal to a cycle of at least one reference signal (reference clock); and an identifier (209) for performing a step of identifying the kind of the disk based on the number of cycle of the wobble signal identified by the determiner (see abstract). However, Kumon et al fails to suggest the use of identifying whether the optical disk is DVD-RW or DVD+RW by identifying the number of the cycle of the wobble is 186 times or 32 times data cycle. But, it is known in the optical data storage and/or retrieval art that a wobble formed by tracks on a DVD-RW has a cycle of 186 times longer than recording clock cycle and a wobble formed by tracks on a DVD+RW has a cycle of 32 times longer than recording clock cycle, and since the device of Kumon et al. identifies the type of disk by measuring/counting the cycle of the

wobble, it is clearly that the DVD-RW or DVD+WR type can be easily identified by measuring/counting its cycle of wobble by the device of Kumom et al.

***Response to Arguments***

3. Applicant's arguments with respect to claims 1 and 2 have been considered but are moot in view of the new ground(s) of rejection.
